Electronic means of communication have become an indispensable attribute of modern life and are actively used in communication. The problem of their use by teenagers is of particular relevance, since the importance of communication with peers in adolescence increases. At the beginning of 2019 and 2020, a survey of Belarusian teenagers (11-15 years old, 439 in total) living in various regions of the country was conducted. Teenagers indicated the frequency of communication with their friend by sending him or her text messages using the smartphone or via the Internet. The answers ranged from "rarely or never" to "daily". Less than half of the schoolchildren in the combined age group (11-15 years old) indicated the daily communication through the capabilities of smartphone and Internet. Only 11% of teenagers do not use or rarely use electronic means of communication. It was determined an increase in the proportion of schoolchildren using electronic means of communication from 11 to 15 years of age. At the beginning of this period, communication using these means is more common among girls than among boys. By the age of 15, the differences between the sexes are no longer noticeable. Older schoolchildren spend less time with friends (after lessons at school). In girls, this is more appreciable than in boys. The importance of communication in adolescence requires taking into account its specifics in order to use the positive aspects and prevent the negative impact of remote communication.
